

ABSTRACT OF THE DISCLOSURE

A watch has a front lid attached to a case band of a timepiece armor main portion through a pivot axle so as to be openable/closable. The front lid is biased in its closing direction by a spring and is provided with an axle fitting portion rotatably fitting to the pivot axle. A spring accommodating hole faces the axle fitting portion and is provided in a position biased by a deviation dimension from an axle center of the pivot axle of the case band. A coil spring is accommodated in the spring accommodating hole in a compressed state, and a spring force of the spring is applied to the axle fitting portion, thereby biasing the front lid in its closing direction.
